

Stefan Zagarov | Front-End Developer

Front-end developer building AI-powered web applications with React and TypeScript. Experienced in taking products from design to production, developing modular front-end architectures and writing tested, maintainable code. Working knowledge of Node.js and Python/Django back-ends.

WORK EXPERIENCE

IT Application Developer

04/2025 - Present

[Semantif.AI](#) | Freelance

Developing front-ends for AI-powered web products, from an internal SaaS platform to client applications.

- Build AI chat assistants for legal research and document analysis with React and TypeScript, streaming answers in real time over WebSockets and showing cited legal provisions and uploaded PDF, Word and Excel files alongside the chat, so users can check responses against their sources.
- Develop core features of an AI learning platform for schools: voice tutoring powered by speech-to-text and text-to-speech APIs (ElevenLabs, Gemini), and an exam generator with KaTeX math rendering and PDF export that helps teachers prepare, assign and review tests.
- Architect the plugin system of a modular SaaS platform in React and TypeScript, allowing new features and external API integrations to be added as plugins without changing the core application, together with switchable themes and layouts for different clients.
- Take client applications from design to production with Tailwind CSS and shadcn/ui, including an image-recognition app for pest-trap monitoring, owning the full front-end from UI and authentication to REST API integration.
- Write unit tests with Vitest and React Testing Library for the plugin, layout and authentication systems to catch regressions early, and document API integration issues to speed up fixes on the back-end.

Software Developer - Unity Engine

06/2022 - 11/2022

[BIMExperts](#)

Developed user-facing features for a 3D architectural modeling application using C# and Unity.

- Implemented an interactive object inventory and placement system, allowing users to select and position building components in the 3D environment.
- Created a blueprint snapshot tool that captures and catalogs all objects in a scene for architectural planning and documentation.
- Designed a messaging and logging system with a dockable UI window and persistent message history.

PROJECTS

Questline

Python, Django, JavaScript

Gamified goal tracker with quest maps and progress tracking.

Natal Chart

React 19, TypeScript, WebAssembly

Interactive astrology chart with astronomical calculations in WebAssembly.

DevDesk

TypeScript, Express, PostgreSQL, Docker

Full-stack knowledge base app with JWT authentication.

Hypertimer

Electron Forge, JavaScript

Desktop timer app with clock modes, persistent storage and extensive customization.

The Drunken Dragon

React

Fantasy storytelling platform with JWT authentication and role-based user system.

ADDITIONAL EXPERIENCE

Warehouse Operations Specialist | Denicom | 10/2023 - 04/2025

Order fulfillment for chain stores and individual clients and inventory management

Sticker Manufacturing Specialist | Unnamed office | 01/2019 - 12/2019

Creating and packaging motorbike decals in a fast-paced environment
