

Stefan Zagarov | Front-End Developer

Junior front-end developer with more than a year of professional experience building web applications with React and TypeScript. Enjoys exploring challenges and finding clean, maintainable solutions, from plugin architectures to real-time interfaces. Background in C# and Unity, with working knowledge of Node.js and Python/Django back-ends.

WORK EXPERIENCE

IT Application Developer

04/2025 - Present

[Semantif.AI](#) | Freelance

Developing front-ends for web products, from an internal SaaS platform to client applications.

- Build AI chat assistants for legal research and document analysis with React and TypeScript, streaming answers in real time over WebSockets and showing cited legal provisions and uploaded PDF, Word and Excel files alongside the chat, so users can check responses against their sources.
- Develop core features of a school platform for teachers, students and parents, where students learn with an AI tutor trained on their course materials: an exam generator with editable geometry figures that teachers assign and review, textbooks turned into step-by-step lesson roadmaps, and real-time voice tutoring.
- Architect the plugin system of a modular SaaS platform in React and TypeScript, allowing new features and external API integrations to be added as plugins without changing the core application, together with switchable themes and layouts for different clients.
- Take client applications from design to production with Tailwind CSS and shadcn/ui, including an AI image-recognition app for pest-trap monitoring, owning the full front-end from UI and authentication to REST API integration.
- Cover core features with unit tests in Vitest, catching regressions before release and keeping refactoring safe.

Software Developer - Unity Engine

06/2022 - 11/2022

[BIMExperts](#)

Developed features for a 3D building documentation application using C# and Unity.

- Built an item inventory system that lets users browse and pick building components for the 3D scene.
- Implemented a world placement system for positioning the selected components in the 3D environment.
- Created a blueprint snapshot tool that captures and catalogs all objects in a scene for planning and documentation.
- Designed a notification and logging system with a dockable UI window and persistent message history.
- Developed small Unity games, including a physics-based Jenga-style tower game and an infinite runner.

PROJECTS

Questline

Python, Django, JavaScript

Gamified goal tracker for building goal roadmaps, tracking progress and sharing them with others.

Natal Chart

React 19, TypeScript, Tauri

Interactive astrology desktop app that casts charts for any time and place using the Swiss Ephemeris engine.

DevDesk

TypeScript, React, Express, PostgreSQL

Full-stack knowledge storage app that keeps every tool and piece of information in one place.

Hypertimer

Electron Forge, JavaScript

Desktop timer app with clock modes, persistent storage and extensive customization.

The Drunken Dragon

React

Fantasy storytelling platform with JWT authentication and role-based user system.

Distortion Pit

Angular, Node.js, Express, MongoDB

Music community app to add bands and songs, like and comment on them, and see them ranked by likes.

ADDITIONAL EXPERIENCE

Warehouse Operations Specialist | Denicom | 10/2023 - 04/2025

Order fulfillment for chain stores and individual clients, and inventory management.

Sticker Manufacturing Specialist | Unnamed office | 01/2019 - 12/2019

Creating and packaging motorbike decals in a fast-paced environment
